THE STATE OF NEW HAMPSHIRE.

OFFICE OF THE REGISTRAR OF VITAL STATISTICS.

CONCORD, Oct. 1, 1896.

To His Excellency the Governor and the Honorable Council:

I have the honor to submit herewith, in accordance with the laws of the State of New Hampshire, the fifteenth report relating to the registration of births, marriages, divorces, and deaths, in this state for the years ending December 31, 1894, and December 31, 1895.

The number of births reported in the state for the year 1894 was 7,860, or 488 less than was reported in 1893; the number of marriages was 3,881, or 209 less than was returned in 1893; the number of deaths was 6,898, or 765 less than in 1893.

The number of births reported in the state for the year 1895 was 8,252, or 392 more than was reported in 1894; the number of marriages was 4,015, or 134 more than returned in 1894; the number of deaths was 6,929, or 31 more than was returned in 1894.

The total population of the state, according to the census of 1890, is 376,530, and the proportion of births, marriages, and deaths, to each one thousand of the population, is as follows:

For the year 1894, birth-rate, 20.87; marriage-rate, 10.30 (couples); divorce-rate, 1.05; death-rate, 18.32.

For the year 1895, birth-rate 21.91; marriage-rate, 10.66 (couples); divorce-rate, 1.08; death-rate, 18.40.

The tables have been arranged substantially as in the last registration report.

Reference should be had to the index at the end of this volume for any subject included in this report.

Respectfully submitted,

Irving A. Watson

Registrar of Vital Statistics.

Table No. 2 represents the population of New Hampshire for each year from 1880 to 1895 inclusive, and is calculated from the census returns of 1880 and 1890. In this table the population for each year except 1880 and 1890 is calculated, and is believed to be approximately correct. The figures in the table mentioned are estimated upon the basis that there has been a steady increase in the population in the same ratio as was shown between the census returns of the two years named.

Table No. 3 shows the population, number of births, marriages, deaths, with the birth-rate, marriage-rate, and death-rate, to each 1,000 of the population, for the years 1884 to 1895, inclusive. It will be seen by the above table that the birth and death rates were considerably lower for the years 1894 and 1895 than for several previous years. This is owing to the fact that premature and still births were excluded from the calculations in both cases, which was not done in previous years.

Table No. 4 gives the population, number of births and the birth-rate per 1,000 of the population, for the several cities of the state. It will be seen by this table that the highest birth-rate for the year 1894 was reported from Laconia, 36.46 per 1,000 of the population, and in 1895 from Nashua, 32.62. The lowest rate for the two years was reported from Keene, 15.31 in 1894, and 19.87 in 1895.

It will readily be seen that the highest birth-rates are returned from the manufacturing centres.

For the year 1894 the birth-rate for each 1,000 of the population was 20.23; for 1895, 21.08.

1894	73.32	26.68
1895	71.65	28.35

Table No. 10 gives the proportion of American to foreign-born persons married for the past fourteen years. It will be seen by this table that for the year 1894, 73.32 per cent. of the persons married were American born, but by reference to Table 5 it will be observed that only 45.38 per cent. of the children born were of American parentage. For the year 1895, 71.65 per cent. of the persons married were American-born, while 45.26 per cent. of the children born in that year were of American parentage. On the other hand, reference to the same tables will show that the birth-rate is relatively very much larger among the foreign-born population.

Table No. 15 presents an interesting study of the divorce question from the standpoint of numbers from 1870 to 1895, inclusive. It will be seen that there has been a relatively large increase in the number of divorces granted in recent years in New Hampshire.

Average	6,917	18.44

The number of deaths returned for the year 1894 was 6,898, and for the year 1895, 6,929. Table No. 19, above given, represents the total number of deaths registered from 1884 to 1895, inclusive, with the percentage for each year to each 1,000 of the population. The lower rates represented in the first years included in the table are, without doubt, due to the fact that a complete registration of deaths was not made to the state in those years. It is believed that the returns since the year 1889 have been as nearly accurate as it is possible to secure under any system of registration. For the past six years the statistics may be considered as very reliable.

Tables 28 and 29 show the mortality among children under five years of age, by seasons, for the years 1894 and 1895. The highest mortality for both years, as it was in previous years, was in the quarter including the months of July, August, and September. The heavy death-rate among children in the

summer months is due largely to cholera infantum and other diarrhœal diseases.

Table No. 41 exhibits the number of deaths from the more prominent so-called zymotic diseases, 1884-1895, inclusive. This table presents an interesting study in showing the fluctuations in these diseases from year to year. It will be seen that of all the diseases in this class, cholera infantum causes the greatest number of deaths, while typhoid fever holds the second place, and diphtheria the third. The total number of deaths in this class in 1895 was considerably less than for several years previous.

* Not classed separately.

Table 42 gives the number of deaths, 1884-1895, inclusive, from the so-called constitutional diseases. Phthisis, which is the most fatal of all the diseases in this class, was the cause of 714 deaths in 1894, and 693 in 1895, the latter number being less than has been reported in several years. A careful study of the subject leads us to believe that the mortality from this disease is slowly diminishing.

There is a remarkable uniformity in the mortality from some of the diseases in this table, and especially is this true of cancer.

Table 43 gives the mortality from the principal local diseases, so-called, from 1884 to 1895, inclusive. The average number of deaths from this class of diseases, since 1884, has been 2,647; for 1895 it was 3,034, a larger number than ever before returned in a single year. This table presents many interesting features for careful study.

Table No. 45 shows the mortality from twenty prominent causes of death from 1884 to 1895, inclusive. In this table, consumption heads the list, as it has always done, with one exception of the year 1892, when pneumonia ranked first and consumption second. This was doubtless due to the prevalence of la grippe. The mortality from the causes named, for the year 1895, is shown in the first column; the number for each of the other years may be found by consulting the Registration Report for the given year. These diseases are placed in the order of their fatality, and the fluctuation in this order from year to year is shown by the figures in the columns under the respective years.

The mortality from pneumonia, by months and quarters, for the past twelve years, is shown in Table No. 77. A study of the mortality rates by quarters shows that the greatest fatality is in the first quarter of the year, while the fewest number of cases occur during the summer months of July, August, and September. It will, of course, be readily understood that climatic conditions are responsible for the fluctuation in the mortality from this disease.

Table No. 79 gives the mortality from diarrhœal diseases from 1884 to 1895, inclusive. In this group of diseases, cholera infantum causes the greatest number of deaths, the mortality being excessive. A study of the Registration reports will disclose the fact that this disease is confined almost entirely to the cities of the state, the highest rate being in the city of Manchester.

The above table, No. 80, gives the mortality from cholera infantum for the past twelve years, with percentage to deaths from all causes and rate per 10,000 of the living population. The number of deaths from this disease in the year 1894 was 400, and in 1895, 411. The average yearly mortality from cholera infantum since 1884 has been 366. The mortality from this disease could be very largely reduced by sanitary measures, and the subject should be considered by local boards of health.

Table No. 85 gives the number of deaths from cancer, with rates to the estimated population and to the mortality from other diseases, 1884 to 1895, inclusive. The most remarkable feature of this table is the striking uniformity in the number of deaths from this disease annually.

Table No. 86 shows the mortality from diphtheria by age-periods, from 1884 to 1895, inclusive. It is gratifying to observe that for the past three years the mortality from this disease has been considerably less than for several years prior to 1893. There was a steady diminution in the mortality from this disease from 1889 to, and including, 1893, while for 1894 and 1895 there was a slight increase over that year. The precautions taken by local boards of health against the spread of diphtheria doubtless account for the diminished mortality.

Table No. 89 shows the mortality from croup for the past twelve years. This table corresponds in rates very closely to the preceding table relating to diphtheria. Indeed, there is no reason why it should not, inasmuch as diphtheria and membranous croup are, in our opinion, one and the same disease, differing only in manifestation. When there is a revision of the classification of disease, it is probable that croup will be merged into diphtheria.

In the above table, No. 90, the mortality from croup and diphtheria are combined for the years 1884 to 1895, inclusive. The total number of deaths for each year, together with the percentage to deaths from all causes and the death-rate to each 10,000 of the living, is shown for each disease.

Table No. 91 shows the number of deaths from typhoid fever for the past twelve years, together with the rate to deaths from all causes and to each 10,000 of the living population. It will be seen by this table that for the past year, 1895, the returns show a smaller number of deaths from this disease than ever before reported, to wit: 99. That the death-rate from this disease is very much less than it was, say twenty years ago, is well known by practising physicians who have been engaged in the profession for that number of years or longer. The diminished mortality from typhoid fever is due to sanitary work and sanitary knowledge, without doubt, and it is only reasonable to believe that it may be still further reduced in the near future.

The mortality from typhoid fever for the period given is shown by ages in Table No. 93. It will be seen by this table that no period of life is exempt from the disease, although the fatality is relatively much lighter in the first years of life.

Table No. 94 exhibits the mortality from kidney diseases for twelve years, 1884 to 1895, inclusive, including Bright's disease, nephritis, other kidney diseases and "dropsy." The latter term is in reality a misnomer, and its classification as a special disease will probably not be maintained after a revision of the causes of death is made. It will be seen that the annual mortality from these causes is large, and that it does not vary materially from year to year. In the year 1895 there were 225 deaths from Bright's and other kidney diseases.

Table No. 95 embraces a statement of the number of deaths from scarlet fever for twelve years, 1884 to 1895, inclusive, together with percentages to deaths from all causes and to each 10,000 of the living population. It will be seen that there was a relatively lower mortality from this disease from 1885 to 1893, and from the latter year to 1895, a considerable increase in the death-rate, although in the latter year there was a slight falling off in the number.
